

IN THE CLAIMS:

1. (CURRENTLY AMENDED) A compact personal token, comprising:
a USB-compliant interface releaseably coupleable to a host processing device;
a token memory;
a token processor, communicatively coupled to the token memory and
communicatively coupleable to the host processing device via the USB-compliant
interface, the token processor for providing the host processing device conditional
access to user private data storable stored in the token memory; and
a user input device, communicatively coupled to the token processor by a path
distinct from the USB-compliant interface, for accepting an input for processing by
the token processor to signal authorization of a token processor operation providing
access to the user private data stored in the token memory, the input in response to a
message received in the token from the host processing device via the USB-compliant
interface invoking the token processor operation, wherein user authentication occurs
on the token.
2. (ORIGINAL) The apparatus of claim 1, wherein the path is entirely
internal to the token.
3. (CANCELED)
- 4 (PREVIOUSLY PRESENTED) The apparatus of claim 1, wherein the
user private data is designated as requiring authorization before access by an
associated identification stored in the memory.
5. (PREVIOUSLY PRESENTED) The apparatus of claim 1, wherein the
user input device comprises at least one pressure-sensitive device actuatable from an
exterior surface of the token.
6. (ORIGINAL) The apparatus of claim 5, wherein the input device
comprises at least one push-button switch.

7. (ORIGINAL) The apparatus of claim 1, further comprising:
an output device, communicatively coupled to the processor by a second path
distinct from the USB-compliant interface, for prompting a user to provide an
authorization of a processor operation.

8. (ORIGINAL) The apparatus of claim 7, wherein the path and the
second path are a common path.

9. (ORIGINAL) The apparatus of claim 7, wherein the output device
prompts the user to provide an authorization of the processor operation when
processor operation requires access to the private data stored in the memory.

10. (ORIGINAL) The apparatus of claim 7, wherein the output device
comprises at least one light-emitting device.

11. (ORIGINAL) The apparatus of claim 7, wherein the output device
comprises at least one aural reproduction device.

12. (ORIGINAL) The apparatus of claim 7, wherein the output device
comprises at least one liquid crystal display (LCD).

13. (ORIGINAL) The apparatus of claim 7, wherein the output device
provides an alphanumeric message indicating that user input is required.

14. (ORIGINAL) The apparatus of claim 13, wherein the alphanumeric
message identifies the processing operation.

15. (ORIGINAL) The apparatus of claim 13, wherein the alphanumeric
message identifies a private key.

16. (CANCELED)

17. (CANCELED)

18. (CURRENTLY AMENDED) A method of authorizing access to private data stored in a token having a processor communicatively coupled to a host processor via a Universal Serial Bus (USB) interface, comprising the steps of:

authenticating a user identity in the token;

accepting a command in the token invoking a token processor operation via the USB interface;

accepting a user input signaling authorization of the token processor operation via an input device;

providing the user input to the token processor via a communication path distinct from the USB-compliant interface; and

processing the user input in the token processor to authorize the invoked token processor operation.

19. (CURRENTLY AMENDED) The method of claim 18, further comprising the [[step]] steps of:

determining if the processor operation requires access to the private data stored in the token; and

prompting a user to authorize the processor operation via an output device communicatively coupled to the processor if the processor operation requires access to private data stored in a memory in the token.

20. (ORIGINAL) The method of claim 19, wherein the output device is communicatively coupled to the processor by a second communication path distinct from the USB-compliant interface.

21. (ORIGINAL) The method of claim 20, wherein the first path and the second path are common.

22. (ORIGINAL) The method of claim 20, wherein the step of determining if the processor requires access to a private key stored in the token comprises the steps of:

determining which data stored in the memory is affected by the processor operation; and

determining whether the data affected by the processor operation is associated with an identification designating the data as a private key.

23. (ORIGINAL) The method of claim 20, wherein the path is entirely internal to the token.

24. (ORIGINAL) The method of claim 20, wherein the input device is a pressure-sensitive device actuatable from an exterior surface of the token.

25. (ORIGINAL) The method of claim 24, wherein the input device is a push-button switch actuatable from an exterior surface of the token.

26. (ORIGINAL) The method of claim 20, wherein the output device comprises at least one light emitting device.

27. (ORIGINAL) The method of claim 20, wherein the output device comprises at least one aural reproduction device.

28. (CURRENTLY AMENDED) The method of claim [[20]] 20, wherein the output device comprises at least one liquid crystal display.

29. (ORIGINAL) The method of claim 20, wherein the step of prompting the user to authorize the processor operation via an output device comprises the step of:

providing an alphanumeric message indicating that user input is required.

30. (ORIGINAL) The method of claim 29, wherein the alphanumeric message identifies the processing operation.

31. (ORIGINAL) The method of claim 29, wherein the alphanumeric message identifies the private data.

32. (CANCELED)

33. (CANCELED)

34. (ORIGINAL) The method of claim 20, wherein the command is an authorization request including a challenge value and the processor operation is a hash function using the challenge value and the private data.

35. (CURRENTLY AMENDED) A program storage device, readable by a computer, tangibly embodying at least one program of instructions executable by the computer to perform method steps of authorizing access to private data stored in a token having a processor communicatively coupled to a host processor via a Universal Serial Bus (USB) interface, the method steps comprising the steps of:

authenticating, in the token, a user identity;

accepting a command in the token invoking a token processor operation via the USB-compliant interface;

determining, in the token, if the token processor operation requires access to the private data stored in the token;

prompting the user to authorize the token processor operation via an output device communicatively coupled to the token processor by a path distinct from the USB-compliant interface if the token processor operation requires access to a private data stored in a memory in the token;

accepting a user input signaling authorization of the token processor operation via an input device; and

providing the user input to the token processor via a communication path distinct from the USB-compliant interface.

36. (ORIGINAL) The program storage device of claim 35, wherein the first path and the second path are common.

37. (ORIGINAL) The program storage device of claim 35, wherein the method step of determining if the processor requires access to a private key stored in the token comprises the steps of:

determining which data stored in the memory is affected by the processor operation; and

determining whether the data affected by the processor operation is associated with an identification designating the data as the private key.

38. (ORIGINAL) The program storage device of claim 35, wherein the path is entirely internal to the token.

39. (ORIGINAL) The program storage device of claim 35, wherein the input device is a pressure-sensitive device actuatable from exterior surface of the token.

40. (ORIGINAL) The program storage device of claim 39, wherein the input device is a push-button switch actuatable from an exterior surface of the token.

41. (ORIGINAL) The program storage device of claim 35, wherein the output device comprises at least one light emitting device.

42. (ORIGINAL) The program storage device of claim 35, wherein the output device comprises at least one aural reproduction device.

43. (ORIGINAL) The program storage device of claim 35, wherein the output device comprises at least one liquid crystal display.

44. (ORIGINAL) The program storage device of claim 35, wherein the method step of prompting the user to authorize the processor operation via an output device comprises the method step of:

providing an alphanumeric message indicating that user input is required.

45. (ORIGINAL) The program storage device of claim 44, wherein the alphanumeric message identifies the processing operation.

46. (ORIGINAL) The program storage device of claim 44, wherein the alphanumeric message identifies the private data.

47. (CANCELED)

48. (CANCELED)

49. (CURRENTLY AMENDED) A compact personal token, comprising:
a USB-compliant interface releaseably coupleable to a host processing device;
a token memory;
a token processor, coupled to the token memory and communicatively
coupleable to the host processing device via the USB-compliant interface, the token
processor for providing the host processing device conditional access to store and
retrieve data storable in the token memory, the data including a personal identification
private to the user; and

a user input device, communicatively coupled to the token processor by a path
distinct from the USB-compliant interface, for accepting a user input describing the
personal identification, the user input device for authenticating by the token the
personal identification private to the user.

50. (ORIGINAL) The apparatus of claim 49, wherein the user input
device comprises a character input device.

51. (CURRENTLY AMENDED) The apparatus of claim 50,
wherein

A compact personal token, comprising:
a USB-compliant interface releaseably coupleable to a host processing device;
a memory;
a processor, coupled to the memory and communicatively coupleable to the
host processing device via the USB-compliant interface, the processor for providing
the host processing device conditional access to store and retrieve data storable in the
memory, the data including a personal identification private to the user; and

a user input device, communicatively coupled to the processor by a path distinct from the USB-compliant interface, for accepting a user input describing the personal identification, the user input device comprising a character input device,

the character input device ~~comprises~~ comprising a wheel having an input position for each character in an input character set.

52. (ORIGINAL) The apparatus of claim 51, wherein each character is selected by depression of the wheel.

53. (CURRENTLY AMENDED) The apparatus of claim [[48]] 49, wherein the user input device comprises a first pressure sensitive device actuatable from an exterior side of the token, and a second pressure sensitive device actuatable from the exterior side of the token, wherein actuation of the first pressure sensitive device selects a character from a character set, and actuation of the second pressure sensitive device enters the character as at least a portion of the personal identification.

54. (CURRENTLY AMENDED) A method of authentication using a token having a processor communicatively coupled to a host processor via a Universal Serial Bus (USB) compliant interface, comprising the steps of:

accepting a command in the token invoking a token processor operation via the USB-compliant interface;

determining if the token processor operation requires access to the personal identification storable in a memory of the token; [[and]]

determining if the personal identification is stored in the memory of the token; prompting the user to enter a personal identification if the token processor operation requires access to the personal identification and the personal identification is not stored in the memory of the token;

accepting a user input comprising a personal identification via an input device; authenticating in the token the user input comprising a personal identification via an input device; and

providing the user input to the processor via a communication path distinct from the USB-compliant interface.

55. (CANCELED)

56. (PREVIOUSLY PRESENTED) The method of claim 54, wherein the step of prompting the user to enter the personal identification number comprises the step of activating a user output device via a second communication path distinct from the USB compliant interface.

57. (ORIGINAL) The method of claim 54, wherein the input device comprises a character input device.

58. (CURRENTLY AMENDED) ~~The method of claim 57, wherein~~
A method of authentication using a token having a processor communicatively coupled to a host processor via a Universal Serial Bus (USB) compliant interface,
comprising the steps of:

accepting a command in the token invoking a processor operation via the USB-compliant interface;

determining if the processor operation requires access to the personal identification storable in a memory of the token;

determining if the personal identification is stored in the memory of the token;
prompting the user to enter a personal identification if the processor operation requires access to the personal identification and the personal identification is not stored in the memory of the token;

accepting a user input comprising a personal identification via an input device;
and

providing the user input to the processor via a communication path distinct from the USB-compliant interface, wherein the input device comprises a character input device, the character input device comprising a wheel having an input position for each character in an input character set.

59. (ORIGINAL) The method of claim 58, wherein each character is selected by depression of the wheel.

60. (ORIGINAL) The method of claim 54, wherein the user input device comprises a first pressure sensitive device actuatable from an exterior side of the token, and a second pressure sensitive device actuatable from an exterior side of the token, wherein actuation of the first pressure sensitive device selects a character from a character set, and actuation of the second pressure sensitive device enters the character as at least a portion of the personal identification.

61. (CURRENTLY AMENDED) A compact personal token, comprising:
a USB-compliant interface releaseably coupleable to a host processing device;
a token memory;
a token processor, communicatively coupled to the token memory and communicatively coupleable to the host processing device via the USB-compliant interface, the token processor for providing the host processing device conditional access to user private data storable in the token memory; and
a user input device, communicatively coupled to the token processor by a path distinct from the USB-compliant interface, the user input device for signaling authorization of a token processor operation invoked by a message received in the token via the USB-compliant interface, wherein the token authenticates user identity.

62. (ORIGINAL) The apparatus of claim 61, wherein the user input device is configured to control an operation of the processor.

63. (ORIGINAL) The apparatus of claim 61, wherein the operation comprises an operation selected from the group comprising:
an encryption operation; and
a decryption operation.

64. (ORIGINAL) The apparatus of claim 61, wherein the operation comprises a digital signature operation using a private key stored in the memory.

65. (ORIGINAL) The apparatus of claim 61, wherein the input device comprises at least one pressure-sensitive device actuatable from an exterior surface of the token.

66. (ORIGINAL) The apparatus of claim 61, wherein the input device comprises at least one push-button switch.

67. (ORIGINAL) The apparatus of claim 61, further comprising an output device, communicatively coupled to the processor by path distinct from the USB-compliant interface, for providing information regarding the operation of the processor.

68. (ORIGINAL) The apparatus of claim 67, wherein the output device comprises at least one light emitting device.

69. (ORIGINAL) The apparatus of claim 67, wherein the output device comprises at least one liquid crystal display.

70. (ORIGINAL) The apparatus of claim 67, wherein the output device comprises at least one aural output device.

71. (CURRENTLY AMENDED) A method of authorizing access to private data stored in a token having a processor communicatively coupled to a host processor via a Universal Serial Bus (USB) interface, comprising the steps of:

authenticating a user identity in the token;

accepting a command in the token invoking a token processor operation via the USB-compliant interface;

accepting a user input to control the token processor operation via an input device; and

providing the user input to the token processor via a communication path distinct from the USB-compliant interface.

72. (ORIGINAL) The method of claim 71, wherein the operation comprises an operation selected from the group comprising:

an encryption operation;

a decryption operation; and

a digital signature operation using a private key.

73. (ORIGINAL) The method of claim 71, wherein the user input device comprises at least one pressure sensitive device actuatable from an exterior surface of the token.

74. (ORIGINAL) The method of claim 71, further comprising the step of: prompting the user to control the processor operation via an output device communicatively coupled to the processor by a second path distinct from the USB-compliant interface.

75. (ORIGINAL) The method of claim 74, wherein the path and the second path are common.

76. (CURRENTLY AMENDED) The method of claim 74, wherein the output device is selected from the group comprising:

a light emitting device;
[[an]] a liquid crystal display; and
an aural reproduction device.

77. (CURRENTLY AMENDED) A compact personal token, comprising:
a USB-compliant interface releaseably coupleable to a host processing device;
a token memory;
a token processor, communicatively coupled to the token memory and
communicatively coupleable to the host processing device via the USB-compliant
interface, the token processor for providing the host processing device conditional
access to data storable in the memory; the token processor for authenticating a user
identity; and

a user output device, communicatively coupled to the USB-compliant
interface, for providing an indication of a data signal from the USB-compliant
interface.

78. (CANCELED)

79. (CANCELED)

80. (CURRENTLY AMENDED) A compact personal token, comprising:
a USB-compliant interface releaseably coupleable to a host processing device;
a token memory;
a token processor, communicatively coupled to the token memory and
communicatively coupleable to the host processing device via the USB-compliant
interface, the token processor for providing the host processing device conditional
access to data storable in the token memory, the token processor authenticating a user
identity; and
a user output device, communicatively coupled to the token processor.

81. (ORIGINAL) The apparatus of claim 80, wherein the user output
device is coupled to the processor by a path distinct from the USB-compliant
interface.

82. (ORIGINAL) The apparatus of claim 80, wherein the user output
device is configured to indicate the operation of the processor.

83. (ORIGINAL) The apparatus of claim 80, wherein the operation
comprises an operation selected from the group comprising:
an encryption operation;
a decryption operation; and
a digital signature operation using a private key.

84. (CURRENTLY AMENDED) The apparatus of claim 80, wherein the
user output device is selected from a group comprising:
at least one light emitting device;
at least one liquid crystal display. display; and
at least one aural device.

85. (ORIGINAL) The apparatus of claim 80, further comprising an input device, communicatively coupled to the processor by path distinct from the USB-compliant interface, for providing information for the operation of the processor.

86. (CURRENTLY AMENDED) A method of authorizing access to private data stored in a token having a processor communicatively coupled to a host processor via a Universal Serial Bus (USB) interface, comprising the steps of:

authenticating in the token a user identity;

accepting a command in the token invoking a token processor operation via the USB-compliant interface; and

signaling the token processor operation via a user output device communicatively coupled to the token processor via a communication path distinct from the USB-compliant interface[.].

87. (ORIGINAL) The method of claim 86, wherein the operation comprises an operation selected from the group comprising:

an encryption operation;

a decryption operation; and

a digital signature operation using a private key.

88. (CANCELED)

89. (ORIGINAL) The method of claim 86, wherein the user output device is selected from the group comprising:

at least one light emitting device;

at least one liquid crystal display; and

an aural device.
